Context
Ac as a Experienced Automation Architect with Insurance Domain Knowledge
Instructions
[MANDATORY] Ask me 5 Objective Questions related to Automation Framework on Insurance Application
[MANDATORY] After Answering first question and upon submission second question should ask
[STRICT] After Answering all 5 questions generate me Automation Framework
[CRITICAL] Suggest me few Points to Convey clients
[MANDATORY] Framework should be neat and understandable
[CRITICAL] DO ADD unnecessary things in framework
Persona
Act as a Delivery Manager to review the Framework before handshake with clients
Output
Generate the Framework in .docx
Tone
Generate review comments in a professional tone

Result

Question 1 of 5 — Automation Framework (Insurance Domain)

Which type of Insurance application have you mostly worked on?

A. Life Insurance
B. Health Insurance
C. Property & Casualty (P&C) Insurance
D. Claims Management System
E. Policy Administration System
F. CRM / Underwriting Platform

Please reply with the option only (Example: B).

B

Question 2 of 5 — Automation Framework (Insurance Domain)

Which Automation UI framework are you currently using or most comfortable with?
A. Selenium + TestNG
B. Playwright
C. Cypress
D. Robot Framework
E. Hybrid Framework (Custom)
F. No Existing Framework
Please reply with the option only (Example: B).
D

Question 3 of 5 — Automation Framework (Insurance Domain)
Which programming language is primarily used in your automation project?
A. Java
B. Python
C. JavaScript / TypeScript
D. C#
E. Mixed Languages
Please reply with the option only (Example: B).
B

Question 4 of 5 — Automation Framework (Insurance Domain)
Which CI/CD or execution strategy is expected for the framework?
A. Jenkins Integration
B. Azure DevOps Pipelines
C. GitHub Actions
D. Scheduled Batch Execution
E. Manual Execution Only
F. Hybrid Execution Model
Please reply with the option only (Example: B).
A,B,C,D

Question 5 of 5 — Automation Framework (Insurance Domain)
What is the primary automation scope for your Insurance application?

A. UI Automation Only
B. API Automation Only
C. UI + API Automation
D. Regression Suite Automation
E. End-to-End Business Flow Automation
F. Data Validation / DB Testing
You can select multiple options if applicable.
Please reply with the option(s) only (Example: C,E).
E

Download the Framework Document – below is the document contents.

Insurance Automation Framework Review Document

Role Perspective: Delivery Manager / Automation Architect

1. Collected Inputs

Category	Selected Option
Insurance Domain	Health Insurance
Automation Framework	Robot Framework
Programming Language	Python
Execution Strategy	Jenkins, Azure DevOps, GitHub Actions, Scheduled Batch Execution
Automation Scope	End-to-End Business Flow Automation

2. Recommended Automation Framework

- Framework Type: Hybrid Robot Framework with Python Libraries
- Architecture: Layered Modular Design
- Design Pattern: Page Object Model (POM)
- Test Execution: Parallel Execution using Pabot
- Reporting: Allure Reports + Robot Native Reports
- Logging: Centralized Logging using Python logging module
- Environment Handling: Configurable via YAML/Properties files
- CI/CD Integration: Jenkins, Azure DevOps, GitHub Actions
- Data Management: Externalized Test Data using Excel/CSV/JSON
- API Validation: RequestsLibrary integration
- Database Validation: Python DB connectors
- Scheduling: Batch execution through Jenkins Cron/Schedulers
- Version Control: Git-based repository management
- Reusable Utilities: Common keywords and helper libraries
- Exception Handling: Screenshot capture and failure trace logging

3. Suggested Folder Structure

```
ProjectRoot/
|
├── resources/
|   ├── keywords/
|   ├── locators/
|   └── testdata/
|
├── tests/
|   ├── smoke/
|   ├── regression/
|   └── e2e/
|
├── libraries/
```

```
|   ├── api/
|   ├── db/
|   └── utilities/
|
├── reports/
├── screenshots/
├── configs/
└── pipelines/
```

4. Client Discussion Points

- Framework supports scalable end-to-end automation for Health Insurance workflows.
- Execution can be triggered through multiple CI/CD platforms based on client ecosystem.
- Reusable keyword-driven approach reduces maintenance effort.
- Parallel execution reduces regression cycle duration.
- Framework supports API + UI validation extensibility for future phases.
- Reporting provides traceability for audit and compliance reviews.
- Environment-independent execution improves deployment flexibility.
- Batch scheduling supports overnight unattended regression runs.

5. Delivery Manager Review Comments

- Framework structure is aligned with enterprise delivery standards.
- Robot Framework with Python is suitable for business-readable automation in Insurance domain.
- CI/CD coverage across Jenkins, Azure DevOps, and GitHub Actions improves delivery adaptability.
- Current proposal avoids unnecessary framework complexity and focuses on maintainability.
- Recommended to implement coding standards and peer review gates before production rollout.
- Ensure test data masking for sensitive Health Insurance customer information.
- Suggested to onboard reporting dashboards for leadership visibility.

6. Final Recommendation

The proposed automation framework is suitable for enterprise-level Health Insurance applications requiring scalable end-to-end automation, CI/CD integration, and maintainable execution architecture.
