Context

Ac as a Automation Test Engineer with 6+ years of experience with Insurance Domain

Instructions

[MANDATORY] Ask me 5 Objective Questions related to Testing Strategy preparation for an Insurance Application

[MANDATORY] After Answering first question and upon submission second question should ask

[STRICT] After Answering all 5 questions generate me Testing Strategy

[CRITICAL] Suggest me few Points to Convey clients and management

[MANDATORY] Testing strategy should be clear and understandable

[CRITICAL] DO NOT ADD unnecessary things in Testing Strategy planning

Persona

Act as a Delivery Manager to review the Testing Strategy plan before handshake with clients

Output

Generate the Framework in .docx

Tone

Act as Automation test lead to correct few testing strategy plans from generated testing strategy plan and add your corrections as a Comments

Question 1 of 5 — Testing Strategy Preparation (Insurance Domain)

Which phase of Insurance application testing requires the highest focus in your project?

A. Policy Creation & Enrollment

B. Claims Processing

C. Member Management

D. Billing & Payments

E. Provider Management

F. Underwriting Workflow

Please reply with the option only (Example: B).

A

Question 2 of 5 — Testing Strategy Preparation (Insurance Domain)

What is the primary testing approach followed in your current project?

A. Manual Testing Only

B. Automation Testing Only

C. Hybrid Testing (Manual + Automation)

D. Risk-Based Testing

E. Agile Continuous Testing

Please reply with the option only (Example: B).

C

Question 3 of 5 — Testing Strategy Preparation (Insurance Domain)

Which type of testing is considered most critical for your Insurance application?

A. Functional Testing

B. Regression Testing

C. API Testing

D. Integration Testing

E. End-to-End Business Validation

F. Data Validation / Database Testing

Please reply with the option only (Example: B).

E & F

Question 4 of 5 — Testing Strategy Preparation (Insurance Domain)

Which test management or defect tracking tools are primarily used in your project?

A. JIRA

B. Azure DevOps

C. TestRail

D. ALM / Quality Center

E. Zephyr

F. Excel-Based Tracking

You can select multiple options if applicable.

Please reply with the option(s) only (Example: A,E).

A

Question 5 of 5 — Testing Strategy Preparation (Insurance Domain)

What is the expected release and execution model for the Insurance application?

A. Sprint-based Agile Releases

B. Monthly Production Releases

C. Continuous Delivery / CI-CD

D. UAT-driven Release Cycle

E. On-demand Hotfix Releases

F. Hybrid Release Model

You can select multiple options if applicable.

Please reply with the option(s) only (Example: A,C).

A,C

Insurance Application Testing Strategy Review Plan

Prepared By: Automation Test Lead / Delivery Manager

1. Project Inputs Collected

Category	Selected Input
High Priority Module	Policy Creation & Enrollment
Testing Approach	Hybrid Testing (Manual + Automation)
Critical Testing Areas	End-to-End Business Validation, Data Validation / Database Testing
Defect Tracking Tool	JIRA
Release Model	Sprint-based Agile Releases, Continuous Delivery / CI-CD

2. Recommended Testing Strategy

- Adopt Hybrid Testing approach combining Manual and Automation validation.
- Prioritize Policy Enrollment and Policy Creation business flows.
- Implement End-to-End testing covering member onboarding to policy issuance.
- Perform Database validation for premium calculation, policy data, and transaction consistency.
- Automate stable regression scenarios for every sprint execution.
- Conduct API validation for upstream/downstream insurance integrations.
- Maintain sprint-wise smoke and regression suites.
- Enable CI/CD execution for automated test suites in deployment pipelines.
- Track defects and traceability through JIRA integration.
- Prepare reusable test data for policy creation and enrollment workflows.
- Perform production-like validation in staging/UAT environments.
- Maintain test evidence and audit logs for compliance tracking.

3. Testing Scope

- UI Functional Validation
- Business Workflow Validation
- Database Verification

- API Integration Testing
- Regression Testing
- Smoke Testing
- UAT Support
- Sprint-wise Validation

4. Points to Convey to Clients and Management

- Testing strategy focuses on business-critical insurance workflows.
- Automation coverage reduces repetitive manual regression effort.
- CI/CD integration enables faster sprint validation cycles.
- Database validation improves data accuracy and policy integrity.
- JIRA-based tracking ensures complete defect traceability.
- End-to-End validation reduces production leakage risks.
- Testing approach supports scalable Agile delivery execution.
- Framework and strategy are aligned for future API and integration expansion.

5. Delivery Manager Review Comments

- Testing strategy is aligned with enterprise Insurance application delivery standards.
- Focus on Policy Enrollment workflows is appropriate due to high business impact.
- Hybrid testing approach provides balance between speed and exploratory validation.
- Database validation inclusion is recommended for insurance premium and member data accuracy.
- Current strategy avoids unnecessary testing overhead and maintains execution clarity.
- CI/CD adoption improves sprint-level release confidence and deployment stability.
- Recommended to maintain reusable regression packs for future scalability.

6. Automation Test Lead Corrections & Suggestions

- Increase automation coverage for high-volume enrollment scenarios.
- Add negative testing for invalid member and policy inputs.
- Introduce data reconciliation checks between UI and backend systems.
- Implement nightly regression execution for sprint stabilization.
- Add API mocks/stubs for unavailable third-party insurance services.

- Improve reusable test data management for multi-environment execution.
- Ensure defect triage meetings are conducted every sprint.

7. Final Recommendation

The proposed testing strategy is suitable for Agile-based Insurance applications requiring scalable End-to-End validation, data verification, sprint-level automation, and CI/CD aligned delivery execution.
